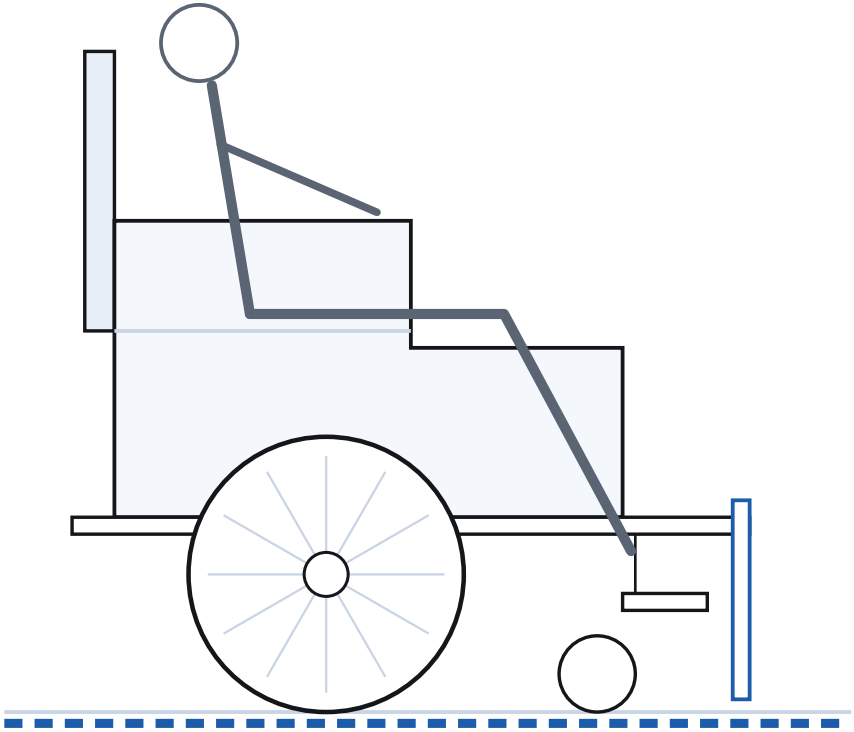
MARGADARSHAK

मार्गदर्शक — the one who shows the way

A wheelchair that takes airport passengers to their gate by itself, for a fraction of what the imported ones cost.



the guide line it follows, laid into the floor

The demonstrator

1:6 scale, 4 mm MDF, two chairs for ₹4,759.
Drive wheels double as the wheelchair's own.

THE PROBLEM

Indian airports must provide wheelchair assistance free, and do not have the attendants to do it. Passengers wait without knowing how long. Delivered to a gate, they are stranded there until somebody remembers them. And when the airline moves the gate, nobody tells the person pushing the chair.

HOW IT WORKS

1. **The passenger scans their boarding pass.**
   Nothing to type, nothing to read, no app.
2. **A laptop in the airport finds the gate.**
   The pass names the flight; the gate is looked up live.
3. **The chair follows a line in the floor.**
   No map, no cloud. It stops for anything in front of it.

If the gate changes mid-journey, the chair is simply re-routed.

A person pushing a wheelchair cannot do that. They set off committed, and nobody tells them.
